I-ELCAP: Baseline regimen
July 1, 2016

**Initial low-dose CT**

**Negative result**
No non-calcified nodules (NCNs)

**Semi-positive result**
Nonsolid NCNs of any size, all solid and part-solid NCNs < 6.0 mm, any NCN, solid or part-solid (solid component) 6.0-14.9 with CT scan 3 months later NOT showing growth at a malignant rate

**Positive result**
NCN, solid or part-solid (solid component) 6.0-14.9 mm, showing growth at a malignant rate on CT scan 3 months later

**Interim baseline cancer:** symptom-prompted diagnosis made prior to 1st annual repeat

If a lung cancer is ultimately diagnosed in semi-positive results regardless of when, it is still classified as a **screen-dx baseline cancer**

**Option B**
if solid nodule ≥ 10 mm or solid component of a part-solid nodule ≥ 10 mm

**PET scan**

**Negative** for lung cancer

**Option A**

**Biopsy**

**Positive or Indeterminate**
POSITIVE for lung cancer
NEGATIVE

**Cough vigorously and Repeat CT scan immediately if possible, otherwise**

**CT scan 1 month later**

*Percentage change consistent with malignancy = \[(diameter at time 2 - diameter at time 1) / diameter at time 1\]*

a) if nodule < 6 mm in diameter, % change ≥ 50% growth,
b) nodules 6-9 mm, % change ≥ 30% growth,
c) nodules > 10 mm, % change ≥ 20% growth
(see calculator on I-ELCAP website)

**Document as screen-dx baseline lung cancer**

**Document as screen-dx baseline lung cancer**

**1st Annual repeat CT**
